

Australia is the second largest exporter of beef in the world.
Source: USDA

Inalca, backed by its international experience, recently set up a new project to promote and spread the use of Australian meat on the European market.

Australian beef is the safest and most reliable currently on the market, as it offers higher standards of quality and stricter controls, that come up to the expectations of European consumers.

Supplying over 100 markets throughout the world, Australia is in fact one of the main beef exporting countries.

In over 40 years this country has perfected a special integrated traceability system that covers the entire life of the product, from birth of the animal right to the packaged cuts of meat.

Also, for decades now Australia has been working on a program for careful genetic selection of the best British beef breeds. This makes it possible to guarantee very high quality meat that is both tender and tasty.
